Executive Summary

This activity focused on using basic Linux commands to create and manage directories and files. I created eight directories and eight files, including workstations and servers in local and remote directories, and user files for fred, daphne, scrappy, and velma in the users directory. Commands such as mkdir, cd, touch, and ls were used to structure and verify the directories and files. The task helped solidify my understanding of how to organize file systems in a Linux environment. Overall, this exercise provided hands-on experience with essential Linux tools commonly used in system administration.
